## Question 01 (OOP)

250

- ❖ Develop a simple banking application in Python, focusing on creating and handling custom exceptions.
- ❖ Custom Exception Classes:
  - ❖ Create two custom exception classes: `InsufficientFundsError` and `InvalidTransactionError`. Both should inherit from Python's built-in `Exception` class.
- ❖ BankAccount Class:
  - ❖ Implement a `BankAccount` class with private attributes: `__account_number` and `__balance`.
  - ❖ Include methods `deposit(amount)` and `withdraw(amount)`.
  - ❖ Ensure that these methods raise `InvalidTransactionError` if the deposit amount is negative, and `InsufficientFundsError` if a withdrawal attempt exceeds the account balance.

## Question 01 (OOP)

350

- ❖ Build a foundational Python application for a library management system, focusing on basic Object-Oriented Programming concepts, private attributes, and custom string representations.
- ❖ **Enhanced Person Class:**
  - ❖ Use the Person abstract class with attributes name, age, and id\_ (representing a unique identifier).
  - ❖ Include an abstract method introduce().
  - ❖ Add a \_\_str\_\_ method to return a string representation of the person.
- ❖ **Subclasses with Specific Roles:**
  - ❖ **Librarian Class:** Inherit from Person. Add employee\_id as a public attribute.
    - ❖ Implement introduce() to return librarian-specific details.
  - ❖ **Member Class:** Also a subclass of Person, with a member\_id.
    - ❖ Implement introduce() to return member information.

## *Question 01 (OOP)*

### ❖ **Book Class with Private Attribute:**

- ❖ Create a Book class with attributes title, author, and a private attribute isbn.
- ❖ Implement a `__str__` method to return a formatted string displaying the book's title and author.

### ❖ **Simple Library Class:**

- ❖ Develop a Library class that manages books and members. Include methods for adding books and registering members.
- ❖ Ensure the class has a `__str__` method to represent the current state of the library (like the number of books and members).

### ❖ **Practical Implementation:**

- ❖ Write a script to demonstrate the functionality of your classes. Create instances of Librarian, Member, and Book, and perform basic operations like adding books to the library.

# Thanks

**Good Luck!**

Don't give up on your dreams 😊
